ABSTRACT:

The **ONLINE SHOPPING SYSTEM** is an application developed to enable hassle-free online transactions between customers and merchants using an online platform. In this online shopping system, customers can register as new users or log in as existing users to view products, manage their shopping carts, and place orders. Once a customer clicks on the checkout option, the system processes the order information and communicates with an external payment gateway service to process secure payment transactions. Once the payment is successfully confirmed, the system automatically generates an invoice, sends confirmation messages to the customer, and generates a shipping request for the delivery partner. Customers can check their order history and cancel orders when necessary, while delivery partners can accept delivery and update the status of orders at various stages of the shipping process. An admin is responsible for monitoring the system by managing customer accounts, handling product inventory, and monitoring the entire system functionality to ensure smooth coordination between all parties involved. In summary, the online shopping system is designed to ensure that online shopping is convenient, secure, and efficient by offering a systematic platform that links customers, merchants, payment services, and delivery partners in an organized workflow.
